EDNA - Retrieval is not evidence validation

Private portfolio design study. Not a client deployment.

Problem and decision user

Research outputs become unreliable when claims lose their source, version, access restriction or correction history. The proposed user is researcher, analyst and knowledge steward.

Operating and economic approach

An operating model for governed research and knowledge reuse. The package joins the business question, product scope, operating handoffs, technology/data assumptions and financial consequences. Existing tools and simpler alternatives remain part of the decision.

Checked result

Nine tests expose and control selected retrieval failures. Both tested modes have hit@1 of 80% on five authored questions; no ranking improvement is established. Citation coverage is measured separately from original-source truth.

Capabilities illustrated

Knowledge operations; data provenance; retrieval evaluation; review economics. These are demonstrated documentary/model mechanisms, not a certification of personal independent mastery.

Limits and next use

A high hit rate on a tiny golden set does not establish answer correctness or generalization. Use the detailed specification and validation memo to scope a real mandate, identify missing data and define the smallest decisive test. Publication and deployment require separate review.
